

WEBSITE HANDOVER GUIDE

Everything you need to run your website.

One platform. Every sport. Every age.

What you're receiving.

A complete, production-ready website. This guide walks through running it, connecting enquiries to your own Google Sheet, putting it live on Vercel, and capturing leads on WhatsApp.

1.1 The code

The full source code is public on GitHub, so any developer you work with (or any of the tools below) can use it directly:

```
https://github.com/tahcin/truesports
```

We recommend creating a free GitHub account for the company and **forking** this repository (one click on the repository page), so you own your copy and can accept updates or make changes independently.

1.2 The pages

PAGE	WHAT IT DOES
Home	Positioning, programs overview, stats, testimonials, photo collage
Programs (7 pages)	Aerial Zone centre & school programs, football, basketball, swimming, SOCATOTS, Brazilian Soccer School, plus Savya Fit
About	Vision, story, mission, founder profile, leadership
Team	The full coaching roster with certifications
Gallery	Curated photos: centre, competitions, football, basketball, swimming, schools
Partner with us	The pitch to schools and residential communities
Contact	Enquiry form (writes to your Google Sheet), map, WhatsApp

1.3 The technology, in plain words

PIECE	CHOICE	WHY IT MATTERS TO YOU
Framework	Next.js + TypeScript	The industry standard. Any web developer can maintain it
Hosting	Vercel (free tier)	Zero servers to manage; free for this site's traffic
Content	Typed files in the repo	No CMS subscription. Copy lives in simple, labelled files
Enquiries	Google Sheets	Leads land in a spreadsheet you own; no vendor
Typeface	Satoshi (Fontshare)	Free for commercial use, no licence fee ever

One thing to ask your designer for: every logo on the site was recovered from your pitch deck as an image. If the original vector files (.ai / .svg) exist for the True Sport and Aerial Zone logos, adding them will sharpen print and large-screen use.

Running the site on a computer.

Ten minutes, no programming knowledge needed. You only need this for previewing changes; the live site runs on Vercel by itself.

2.1 Install the tools (once)

- **Node.js:** download the LTS version (20 or newer) from nodejs.org and install with defaults.
- **Git:** from git-scm.com, install with defaults.

2.2 Get the code and start it

Open a terminal (on Windows: press Start, type `cmd`) and run these four lines:

```
git clone https://github.com/tahcin/truesports.git
cd truesports
npm install
npm run dev
```

Then open `http://localhost:3000` in a browser. The site reloads automatically as files change. Press `Ctrl+C` in the terminal to stop it.

GOOD TO KNOW

A production build (`npm run build`) needs an internet connection: the Satoshi typeface loads from the Fontshare service at build time, which is a condition of its free licence.

2.3 Where the words live

All copy sits in the `content/` folder as plain, labelled text files. Edit the text between quotes, save, and the page updates. The main ones:

FILE	CONTROLS
<code>content/site.ts</code>	Phone number, address, hours, email, social links, menu
<code>content/home.ts</code>	Homepage headline, stats, testimonials
<code>content/programs/...</code>	One file per program: ages, batches, outcomes, coaches
<code>content/coaches.ts</code>	The team page roster
<code>content/gallery.ts</code>	Which photos show on the gallery page, with captions

2.4 Where the photos live

Images sit in `public/photos/` (gallery additions in `public/photos/gallery/`). To add a photo: copy the file in, give it a clear name like `football-tournament-2027.jpg`, and add one entry for it in `content/gallery.ts` following the pattern already there.

Enquiries into your own Google Sheet.

The contact form sends every enquiry to a spreadsheet through a small script that lives inside the sheet itself. Free, no vendor, and the sheet stays private to you. Setup is about ten minutes, once.

3.1 Create the sheet and add the script

1. With the company Google account, create a new spreadsheet at sheets.new. Name it **True Sport Enquiries**.
2. In the menu: **Extensions → Apps Script**. A code editor opens.
3. Delete whatever is in the editor and paste the contents of `google-sheet-webhook/Code.gs` from the repository (also printed in the appendix of this guide).
4. Save with `Ctrl+S`.

3.2 Publish the script as a web address

1. Top right of the editor: **Deploy → New deployment**.
2. Click the gear next to “Select type” and choose **Web app**.
3. Set **Execute as: Me** and **Who has access: Anyone**. The second one is what lets the website submit to it; the sheet itself stays private.
4. Click **Deploy** and approve the permission prompt. Google warns that the script is unverified because it is your own script, which is expected.
5. Copy the **Web app URL**. It ends in `/exec`.

3.3 Give the website that address

The site reads the address from a setting named `SHEET_WEBHOOK_URL`:

- **On Vercel** (the live site): Project → **Settings → Environment Variables** → add `SHEET_WEBHOOK_URL` with the copied URL as the value, then redeploy. Section 04 shows exactly where.
- **Locally** (optional): create a file named `.env.local` in the project folder containing `SHEET_WEBHOOK_URL=https://script.google.com/macros/s/.../exec`

Submit a test enquiry from the contact page. A row should appear in a tab named **Enquiries** within a few seconds, with columns for timestamp, name, phone, email, program and message. The tab and headers create themselves on the first submission.

TWO THINGS WORTH REMEMBERING

Editing the script later? Saving is not enough. Use Deploy → Manage deployments → edit → **New version**, or the live URL keeps running the old code.

If the sheet is ever unreachable, the form automatically hands the enquiry to WhatsApp instead, so no lead is lost.

Putting it live on Vercel.

Vercel builds and hosts the site straight from GitHub. The free Hobby plan comfortably covers this site's traffic. After setup, every change pushed to GitHub goes live by itself in about a minute.

4.1 Import the project

1. Create an account at vercel.com/signup with the company GitHub account (sign up **with GitHub**, it links them in one step).
2. Click **Add New → Project**.
3. Pick your fork of `trueports` from the list and click **Import**.
4. Vercel detects Next.js automatically. Change nothing.
5. Open the **Environment Variables** panel on that same screen and add `SHEET_WEBHOOK_URL` with your web app URL from Section 03.
6. Click **Deploy**. Two to three minutes later the site is live on a `*.vercel.app` address.

4.2 Connect your domain

1. In the project: **Settings → Domains** → type your domain (for example `trueportsolutions.in`) → **Add**.
2. Vercel shows one or two DNS records. In the website of your domain registrar (where the domain was bought), add them:
 - An **A record** for `@` pointing to `76.76.21.21`
 - A **CNAME record** for `www` pointing to `cname.vercel-dns.com`
3. Wait for the check marks (minutes to a few hours). HTTPS certificates are automatic.

The site notices its own address automatically: share links, the sitemap and social preview cards all switch to the new domain on the next deployment, with no code change.

4.3 Publishing a change, end to end

Edit a content file → save → push to GitHub (or edit the file directly on github.com and press Commit). Vercel rebuilds and the change is live in about a minute. Every deployment is kept, so any mistake can be undone from the Vercel dashboard with **Instant Rollback**.

SEARCH ENGINES

After the domain is live, add the site to [Google Search Console](#) and submit `https://your-domain/sitemap.xml`. The sitemap already exists and maintains itself.

Capturing leads on WhatsApp.

Most parents will simply message you. The site is already wired for that, and with fifteen minutes in the WhatsApp Business app it becomes a simple bot form that collects the details you need before you even reply.

5.1 What the website already does

Every WhatsApp button on the site opens a chat with **+91 89047 28080** and a pre-filled message (“Hi! I’d like to book a free trial for my child.”), so every conversation starts with intent. If the Google Sheet is ever unreachable, the enquiry form falls back to WhatsApp too.

5.2 The fifteen-minute bot form (free)

In the **WhatsApp Business** app on the business phone, open **Settings → Business tools** and set up three things:

1. **Greeting message** (sends itself to every new chat). Suggested text:

Hi! Thanks for reaching out to True Sport 🙋
 So we can book your free trial quickly, please share:
 1. Your child's name and age
 2. The sport: gymnastics, football, basketball or swimming
 3. Your school or community name
 We reply the same day, Mon to Sat.

2. **Away message:** the same text, shown outside working hours with a note about when you reply.
3. **Quick replies:** save canned answers under shortcuts, so typing `/trial` inserts the trial details, `/fees` the fee sheet, `/address` the centre location and map link.

The greeting does the “form” work: parents answer the three questions in their first reply, and each chat arrives pre-qualified. Log each lead as a row in the same enquiries sheet, and mark a **Source** column as WhatsApp so you can compare it with the website form.

5.3 When volume grows: a real automated bot

Once enquiries outgrow manual replies, move the number to the WhatsApp Business Platform through an Indian provider such as **AiSensy**, **WATI** or **Interakt**. They provide a drag-and-drop bot builder: the bot asks the same three questions, writes every answer to Google Sheets through their built-in integration, and hands the chat to a human when the parent is ready.

- Plans start around ₹1,000—2,500 per month plus small per-conversation fees.
- The number moves off the phone app and onto their dashboard, and the buttons on the website keep working unchanged, since they only point at the number.
- Worth it when you handle more than roughly 10—15 enquiries a day; below that, section 5.2 is enough.

Handover checklist.

Everything that should end up owned by a True Sport account, so nothing depends on us being reachable.

ITEM	ACTION	WHERE
Code repository	Fork <code>tahcin/truesports</code> into a company GitHub account	github.com
Hosting	Import the fork into a company Vercel account (Section 04)	vercel.com
Enquiries sheet	Create under the company Google account (Section 03)	sheets.new
Webhook setting	Add <code>SHEET_WEBHOOK_URL</code> in Vercel project settings	Vercel → Settings
Domain	Point DNS at Vercel (Section 4.2)	Your registrar
WhatsApp	Greeting, away message and quick replies on +91 89047 28080	WhatsApp Business app
Search Console	Verify the domain, submit the sitemap	search.google.com
Content still pending	Real testimonials, centre hours, confirmed email address	content/ files
Logo vectors	Locate original .ai/.svg files if they exist	Your designer

Costs, honestly

ITEM	COST
Hosting (Vercel Hobby)	Free at this site's traffic
Enquiries (Google Sheets)	Free
Typeface licence	Free (Fontshare, commercial use permitted)
Domain renewal	Whatever your registrar charges yearly
WhatsApp bot (optional, later)	₹1,000—2,500/month via AiSensy, WATI or Interakt

The sheet script.

The exact code Section 03 asks you to paste into Apps Script. It also lives in the repository as `google-sheet-webhook/Code.gs`, so copy from there rather than retyping.

```
var SHEET_NAME = 'Enquiries';

function doPost(e) {
  var data = JSON.parse(e.postData.contents);
  var ss = SpreadsheetApp.getActiveSpreadsheet();
  var sheet = ss.getSheetByName(SHEET_NAME) || ss.insertSheet(SHEET_NAME);
  if (sheet.getLastRow() === 0) {
    sheet.appendRow(['Timestamp', 'Name', 'Phone', 'Email', 'Program', 'Message']);
    sheet.setFrozenRows(1);
  }
  sheet.getRange('C:C').setNumberFormat('@');
  sheet.getRange('A:A').setNumberFormat('dd/mm/yyyy hh:mm:ss');
  sheet.getRange(sheet.getLastRow() + 1, 1, 1, 6).setValues([[
    new Date(), data.name || '', data.phone || '',
    data.email || '', data.program || '', data.message || ''
  ]]);
  return ContentService.createTextOutput(JSON.stringify({ ok: true }))
    .setMimeType(ContentService.MimeType.JSON);
}
```

What it does, in one line each: receives the form submission, creates the **Enquiries** tab with headers on first use, formats the phone column as text so numbers starting with `+` display correctly, and appends the enquiry as a new row with a timestamp.

Built as a live project, handed over for the long run.

This website was designed and built by **Priyanshi** and **Tahcin** as a live project for the BBA in Digital Business & Entrepreneurship, working from True Sport's brief, brand assets and two decades of work in Bengaluru's grassroots sport.

Thank you for trusting us with it. The medals follow.
